Transport Demand on the Rise
Transport accounts for about a quarter of global energy-related carbon emissions. This contribution is rising faster than for any other energy end-use sector. Without aggressive and sustained policy intervention, direct transport carbon emissions could double by 2050.

Co-Benefits
Efficient, low-carbon transport systems have significant co-benefits, such as better access to mobility services for the poor, time saving, energy security, and reduced urban pollution leading to better health. Some studies suggest that the direct and indirect benefits of sustainable transport measures often exceed the cost of their implementation.
